Surh Anor

Description of Varieties

- *Blush seedless* produces sizable clusters of large red berries with little cluster manipulation. The vine is somewhat cold tolerant.
- *Flame seedless* has set the standards for table grape quality around the world. It is a vigorous vine which is somewhat sensitive to cold winter temperatures. Clusters require gibberellic acid (GA) to attain adequate berry size.
- *Thompson seedless* is a very vigorous vine on fertile soil and produces long clusters of small berries without GA applications. The vine is sensitive to cold and should be cane pruned and heavily cluster thinned for best production.
- *Reliance* is a very sweet, small-clustered pink variety with small berries. Production and cold tolerance are excellent, but quality is subjective and atypical.
- *Glenora* is a small-clustered New York grape with excellent cold tolerance. Berries are small but have excellent flavor.
- *Autumn seedless* is a late-ripening white grape with large berries and medium sized clusters. It is somewhat sensitive to cold.
- *Himrod* is a very productive white grape with excellent cold and some frost tolerance. Clusters are typically loose and berry quality is fair to good.
- *Romulus* is a white grape with good quality and good cold tolerance.
- *Vanessa* has outstanding quality and a crisp, fruity flavor. Production and cold tolerance are good.
- *Centennial seedless* produces medium clusters of large, white, oval-shaped berries. Production is fair as the vine is somewhat sensitive to cold.
- *Orlando seedless* is a long-clustered, light green, white berry variety with Pierce's disease resistance. It is a vigorous vine with some cold tolerance.
