## Water Service Line Inspections

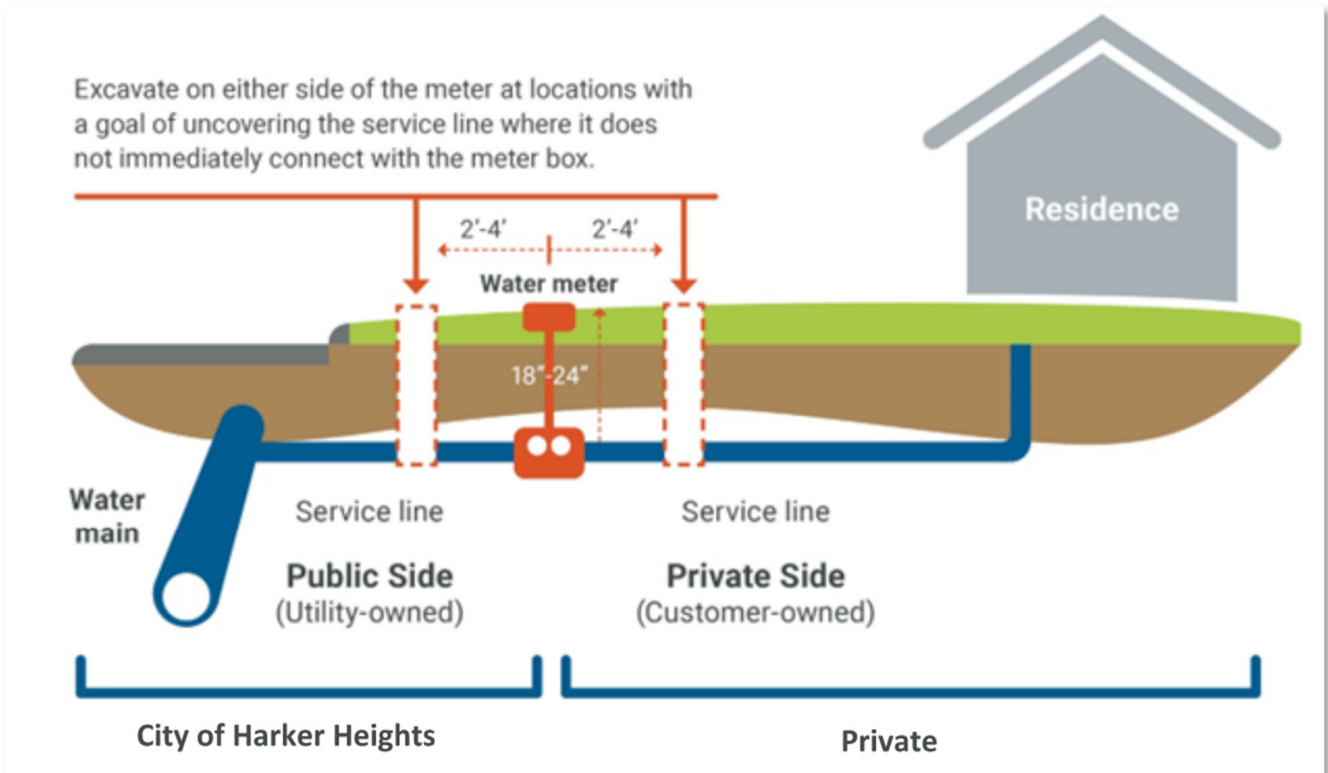

Dear Customer,

The City of Harker Heights is asking you to assist with an inspection program required by the EPA and TCEQ. We are inspecting the water service lines that bring water to residences from the water main.

### Accessing Property Details

We will have a crew of 2 – 3 people to come on the property and perform the following activities around the meter box:

- Take photos of existing conditions of the property at the water meter.
- Determine the best location for two inspection holes. We will excavate one hole on each side of the water meter (public and private sides). Each hole will be between 2 to 4 feet from the meter box. **Crews will minimize private property disturbance.**
- Excavate two 12 to 18-inch holes that are approximately 18-24 inches deep. The depth depends on where the service line is located at each residence.
- Inspect the service line to determine the pipe material and take photos.
- Crews will fill the holes with the material they removed, restore the ground surface and take final photos.
- Restoration will be provided as needed.

Inspection activities should take approximately one to two hours to complete. **Crews will not need to enter your home for this inspection.**
